

# How do scientists write predictions and conclusions?

1. Think of **three easy science experiments** you can do at home. (Examples: *How fast does an ice cube melt? How quickly does sugar dissolve in water? Which materials float in water?*)
2. Before you gather your **materials and equipment**, make a **prediction** for what will happen in each **experiment** in the table below.
3. **Conduct your experiments** and write up your **conclusions**. Did they match your **predictions** or were they different?

Experiment	Prediction	Conclusion
