

# Types of rock

## Guided reading

Rock is a solid mass of minerals that have joined together over time.

They are natural and not man-made.

There are three main types of rock that are found on Earth:

Sedimentary rocks are made up of tiny broken pieces of rocks, crystals or minerals.

Igneous rocks are formed from magma or lava.

A metamorphic rock starts out as either sedimentary or igneous, but it then changes into another when subject to either high heat or massive pressure, or both.

## Questions

1. What are sedimentary rocks made up of?

---

---

2. How are igneous rocks formed?

---

---

3. What creates a metamorphic rock?

---

---
