# Menstrual Cycle **Hormones**

Cut out the cards below and reorganise them into the correct sequence.

This causes the **ovary** to release the **egg** cell **(ovulation).**

**LH** (luteinising hormone) is produced by the **pituitary gland.**

This causes an **egg** to develop in one of the **ovaries**, and **stimulates** the production of **oestrogen.**

This causes the lining of the **uterus** to repair, and **stimulates** the production of **LH** and **inhibits FSH.**

**Progesterone** is produced in the **ovaries.**

**Oestrogen** is produced in the **ovaries.**

**FSH** (follicle stimulating hormone) is produced in the **pituitary gland.**

This causes the **uterus** lining to be **maintained** and **inhibits** the production of **LH.**

# Menstrual Cycle **Hormones (Answers)**

**FSH** (follicle stimulating hormone) is produced in the **pituitary gland.**

This causes an **egg** to develop in one of the **ovaries**, and **stimulates** the production of **oestrogen.**

**Oestrogen** is produced in the **ovaries.**

This causes the lining of the **uterus** to repair, and **stimulates** the production of **LH** and **inhibits FSH.**

**LH** (luteinising hormone) is produced by the **pituitary gland.**

This causes the **ovary** to release the **egg** cell **(ovulation).**

**Progesterone** is produced in the **ovaries.**

This causes the **uterus** lining to be **maintained** and **inhibits** the production of **LH.**
